In addition, the interpretation of seismic profiles indicates that the central part of this plain is marked by the diapirism of Triassic rocks. The combination of these results with those of the surface (geological map and shallow hydrogeological boreholes) has led us to propose a kinematic model of the Bizerte region since the Middle Miocene and to update the structural scheme.

### Fault-style analysis and seismic interpretation ...

Thus, seismic images of growth folds can be used to identify the folding mechanisms, which in turn can dictate the kinematic theory (e.g., fault-bend folding or detachment folding) that is most appropriate to guide the structural interpretation of the seismic data. In fault-related folds that develop purely by kink-band migration, fold limbs widen through time while maintaining a fixed dip, as illustrated in the sequential model involving pre-growth strata only (Figure 3, left).
